Introduction to the dataRetrieval package

Laura De Cicco[1] and Robert Hirsch[1]

[1] *United States Geological Survey*

January 23, 2013

Contents

1 Introduction to dataRetrieval

The dataRetrieval package was created to simplify the process of getting hydrologic data in the R enviornment. It has been specifically designed to work seamlessly with the EGRET

package: Exploration and Graphics for RivEr Trends (EGRET). See: https://github.com/USGS-R/EGRET/wiki for information on EGRET.

There is a plethora of hydrological data available on the web. This package is designed specifically to load United States Geological Survey (USGS) hydrologic data to the R enviornment. This includes daily values, real-time (unit values), site information, and water quality sample data.

2 Getting Started

This section describes the options for downloading and installing the dataRetrieval package.

2.1 New to R?

If you are new to R, you will need to first install the latest version of R, which can be found here: http://www.r-project.org/.

There are many options for running and editing R code, one nice enviornment to learn R is RStudio. RStudio can be downloaded here: http://rstudio.org/. Once R and RStudio are installed, the dataRetrieval package needs to be installed as described in the next section.

2.2 R User: Installing dataRetrieval from downloaded binary

The latest dataRetrieval package build is available for download at https://github.com/USGS-R/dataRetrieval/blob/master/dataRetrieval_1.2.1.tar.gz. If the package's tar.gz file is saved in R's working directory, then the following command will fully install the package:

```
> install.packages("dataRetrieval_1.2.1.tar.gz", repos = NULL,
+     type = "source")
```

If the downloaded file is stored in an alternative location, include the path in the install command. A Windows example looks like this (notice the direction of the slashes, they are in the opposite direction that Windows normally creates paths):

```
> install.packages("C:/RPackages/Statistics/dataRetrieval_1.2.1.tar.gz",
+     repos = NULL, type = "source")
```

A Mac example looks like this:

```
> install.packages("/Users/userA/RPackages/Statistic/dataRetrieval_1.2.1.tar.gz",
+     repos = NULL, type = "source")
```

It is a good idea to re-start the R enviornment after installing the package, especially if installing an updated version (that is, restart RStudio). Some users have found it necessary to delete the previous version's package folder before installing newer version of dataRetrieval. If you are experiencing issues after updating a package, trying deleting the package folder - the default location for Windows is something like this: C:/Users/userA/Documents/R/win-library/2.15/dataRetrieval, and the default for a Mac: /Users/userA/Library/R/2.15/library/dataRetrieval. Then, re-install the package using the directions above. Moving to CRAN should solve this problem.

After installing the package, you need to open the library each time you re-start R. This is done with the simple command:

```
> library(dataRetrieval)
```

Using RStudio, you could alternatively click on the checkbox for dataRetrieval in the Packages window.

2.3 R Developers: Installing dataRetrieval from gitHub

Alternatively, R-developers can install the latest version of dataRetrieval directly from gitHub using the devtools package. devtools is available on CRAN. Simpley type the following commands into R to install the latest version of dataRetrieval available on gitHub. Rtools (for Windows) and latex tools are required.

```
> library(devtools)
> install_github("dataRetrieval", "USGS-R")
```

To then open the library, simply type:

```
> library(dataRetrieval)
```

3 USGS Web Retrieval Examples

In this section, we will run through 5 examples, documenting how to get raw data from the web. This includes historical daily values, real-time current values, water quality data, site information, and measured parameter information. We will use the Choptank River near Greensboro, MD as an example. The site-ID for this gage station is 01491000. Daily discharge measurements are available as far back as 1948. Additionally, forms of nitrate have been measured dating back to 1964. The functions/examples in this section are for raw data retrieval. This may or may not be the easiest data to work with. In the next section, we will use functions that retrieve and process the data in a dataframe very friendly for R analysis.

3.1 USGS Web Retrieval Introduction

The United States Geological Survey organizes their hydrological data in fairly standard structure. Gage stations are located throughout the United States, each station has a unique ID. Often (but not always), these ID's are 8 digits. The first step to finding data is discoving this 8-digit ID. One potential tool for discovering data is Environmental Data Discovery and Transformation (EnDDaT): `http://cida.usgs.gov/enddat/`. Follow the example in the User's Guide to learn how to discover USGS stations and available data from any location in the United States. Essentially, you can create a Project Location on the map, set a bounding box (in miles), then search for USGS Time Series and USGS Water Quality Data. Locations, ID's, available data, and available time periods will load on the map and appropriate tabs.

Once the site-ID is known, the next required input for USGS data retrievals is the 'parameter code'. This is a 5-digit code that specifies what measured paramater is being requested. A complete list of possible USGS parameter codes can be found here:

`http://nwis.waterdata.usgs.gov/usa/nwis/pmcodes?radio_pm_search=param_group&pm_group=All+--+include+all+parameter+groups&pm_search=&casrn_search=&srsname_search=&format=html_table&show=parameter_group_nm&show=parameter_nm&show=casrn&show=srsname&show=parameter_units`

Not every station will measure all parameters. The following is a list of commonly measured parameters:

Table 1: Commonly found USGS Parameter Codes

	pCode	shortName
1	00060	Discharge [cfs]
2	00065	Gage height [ft]
3	00010	Temperature [C]
4	00045	Precipitation [in]
5	00400	pH

For real-time data, the parameter code and site ID will suffice. The USGS stores historical

data as daily values however. The statistical process used to store the daily data is the final requirement for daily value retrievals. A 5-digit 'stat code' specifies the requested processing. A complete list of possible USGS stat codes can be found here:

`http://nwis.waterdata.usgs.gov/nwis/help/?read_file=stat&format=table`

The most common stat codes are:

Table 2: Commonly found USGS Stat Codes

	StatCode	shortName
1	00001	Maximum
2	00002	Minimum
3	00003	Mean
4	00008	Median

3.2 USGS Site Information Retrievals

To obtain all of the available site information, use the getSiteFileData function:

```
> siteNumber <- "01491000"
> ChopTankInfo <- getSiteFileData(siteNumber)
```

The available data for these for the USGS sites are:

```
> colnames(ChopTankInfo)
```

```
 [1] "agency.cd"             "site.no"              "station.nm"
 [4] "site.tp.cd"            "lat.va"               "long.va"
 [7] "dec.lat.va"            "dec.long.va"          "coord.meth.cd"
[10] "coord.acy.cd"          "coord.datum.cd"       "dec.coord.datum.cd"
[13] "district.cd"           "state.cd"             "county.cd"
[16] "country.cd"            "land.net.ds"          "map.nm"
[19] "map.scale.fc"          "alt.va"               "alt.meth.cd"
[22] "alt.acy.va"            "alt.datum.cd"         "huc.cd"
[25] "basin.cd"              "topo.cd"              "instruments.cd"
[28] "construction.dt"       "inventory.dt"         "drain.area.va"
[31] "contrib.drain.area.va" "tz.cd"                "local.time.fg"
[34] "reliability.cd"        "gw.file.cd"           "nat.aqfr.cd"
[37] "aqfr.cd"               "aqfr.type.cd"         "well.depth.va"
[40] "hole.depth.va"         "depth.src.cd"         "project.no"
[43] "queryTime"
```

Pulling out a specific example piece of information, in this case station name can be done as follows:

```
> ChopTankInfo$station.nm
```

```
[1] "CHOPTANK RIVER NEAR GREENSBORO, MD"
```

Site information is obtained from `http://waterservices.usgs.gov/rest/Site-Test-Tool.html`

3.3 USGS Parameter Information Retrievals

To obtain all of the available information concerning a measured parameter, use the getParameterInfo function:

```
> parameterCd <- "00618"
> parameterINFO <- getParameterInfo(parameterCd)
```

The available data for these for the USGS sites are:

```
> colnames(parameterINFO)
```

```
[1] "parameter_cd"       "parameter_group_nm" "parameter_nm"
[4] "casrn"              "srsname"            "parameter_units"
```

Pulling out a specific example piece of information, in this case station name can be done as follows:

```
> parameterINFO$parameter_nm
```

```
[1] "Nitrate, water, filtered, milligrams per liter as nitrogen"
```

Parameter information is obtained from `http://nwis.waterdata.usgs.gov/nwis/pmcodes/`

3.4 USGS Daily Value Retrievals

To obtain historic daily records of USGS data, use the retrieveNWISData function. The arguments for this function are siteNumber, parameterCd, startDate, endDate, statCd, and a logical (true/false) interactive. There are 2 default argument: statCd defaults to ”00003” and

interactive defaults to TRUE. If you want to use the default values, you do not need to list them in the function call. Setting the 'interactive' option to true will walk you through the function. It might make more sense to run large batch collections with the interactive option set to FALSE.

The dates (start and end) need to be in the format "YYYY-MM-DD". Setting the start date to "" will indicate to the program to ask for the earliest date, setting the end date to "" will ask for the latest available date.

```
> siteNumber <- "01491000"
> parameterCd <- "00060"
> startDate <- ""
> endDate <- ""
> discharge <- retrieveNWISData(siteNumber, parameterCd, startDate,
+     endDate)
```

A dataframe is returned that looks like the following:

```
  agency_cd  site_no   datetime X02_00060_00003 X02_00060_00003_cd
1      USGS 01491000 1948-01-01             190                   A
2      USGS 01491000 1948-01-02             900                   A
3      USGS 01491000 1948-01-03             480                   A
4      USGS 01491000 1948-01-04             210                   A
5      USGS 01491000 1948-01-05             210                   A
6      USGS 01491000 1948-01-06             220                   A
```

The structure of the dataframe is:

```
'data.frame':        23764 obs. of  5 variables:
 $ agency_cd         : chr  "USGS" "USGS" "USGS" "USGS" ...
 $ site_no           : chr  "01491000" "01491000" "01491000" "01491000" ...
 $ datetime          : Date, format: "1948-01-01" "1948-01-02" ...
 $ X02_00060_00003   : num  190 900 480 210 210 220 160 130 120 100 ...
 $ X02_00060_00003_cd: chr  "A" "A" "A" "A" ...
```

Note that dateTime is automatically imported as a Date. Each requested parameter has a value and remark code column. The names of these columns depend on the requested parameter and stat code combinations. USGS remark codes are often "A" (approved for publication) or "P" (provisional data subject to revision). A more complete list of remark codes can be found here: `http://waterdata.usgs.gov/usa/nwis/help?codes_help`

Another example that doesn't use the defaults would be a request for mean and maximum daily temperature and discharge in early 2012:

```
> siteNumber <- "01491000"
> parameterCd <- "00010,00060"
> statCd <- "00001,00003"
> startDate <- "2012-01-01"
> endDate <- "2012-06-30"
> temperatureAndFlow <- retrieveNWISData(siteNumber, parameterCd,
+     startDate, endDate, StatCd = statCd, interactive = FALSE)
```

Daily data is pulled from `http://waterservices.usgs.gov/rest/DV-Test-Tool.html`.

An example of plotting the above data (Figure 1):

```
> with(temperatureAndFlow, plot(datetime, X01_00010_00003, xlab = "Date",
     ylab = "Temperature [C]"))
> par(new = TRUE)
> with(temperatureAndFlow, plot(datetime, X02_00060_00003, col = "red",
     type = "l", xaxt = "n", yaxt = "n", xlab = "", ylab = "",
     axes = FALSE))
> axis(4, col = "red", col.axis = "red")
> mtext("Discharge [cfs]", side = 4, line = 3, col = "red")
```

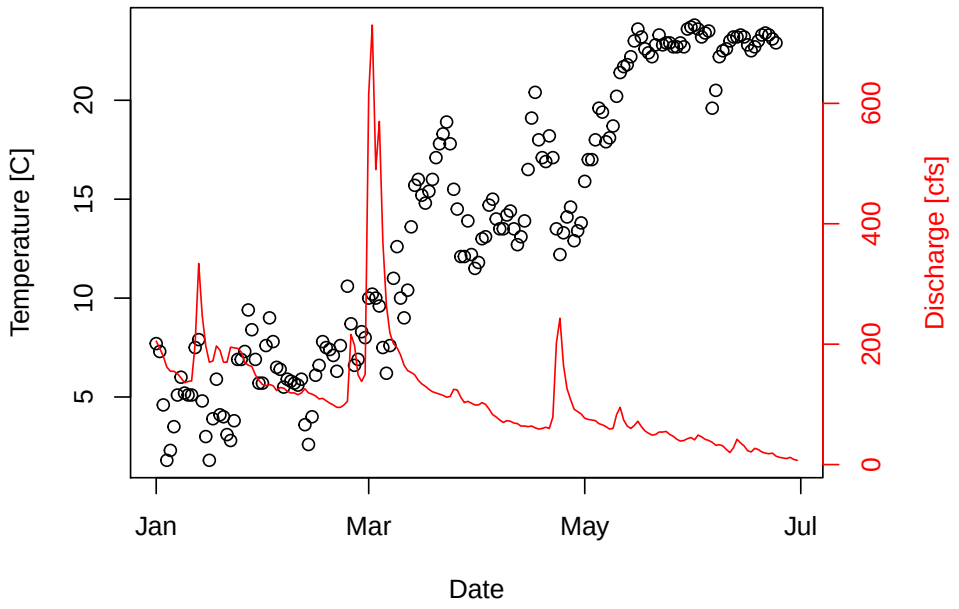

Figure 1: Temperature and discharge plot of Choptank River in 2012.

There are occasions where NWIS values are not reported as numbers, instead there might be text describing a certain event such as "Ice". Any value that cannot be converted to a number will be reported as NA in this package.

3.5 USGS Unit Value Retrievals

We can also get real-time, instantaneous measurements using the retrieveUnitNWISData function:

```
> siteNumber <- "01491000"
> parameterCd <- "00060"
> startDate <- as.character(Sys.Date() - 1)
> endDate <- as.character(Sys.Date())
> dischargeToday <- retrieveUnitNWISData(siteNumber, parameterCd,
    startDate, endDate)
```

Which produces the following dataframe:

```
  agency_cd  site_no            datetime tz_cd X02_00060 X02_00060_cd
1      USGS 01491000 2013-01-22 00:00:00   EST       209            P
2      USGS 01491000 2013-01-22 00:15:00   EST       209            P
3      USGS 01491000 2013-01-22 00:30:00   EST       209            P
```

```
4      USGS 01491000 2013-01-22 00:45:00   EST       209            P
5      USGS 01491000 2013-01-22 01:00:00   EST       209            P
6      USGS 01491000 2013-01-22 01:15:00   EST       209            P
```

The structure of the dataframe is:

```
'data.frame':        166 obs. of  6 variables:
 $ agency_cd   : chr  "USGS" "USGS" "USGS" "USGS" ...
 $ site_no     : chr  "01491000" "01491000" "01491000" "01491000" ...
 $ datetime    : POSIXct, format: "2013-01-22 00:00:00" "2013-01-22 00:15:00" ...
 $ tz_cd       : chr  "EST" "EST" "EST" "EST" ...
 $ X02_00060   : num  209 209 209 209 209 209 211 206 206 206 ...
 $ X02_00060_cd: chr  "P" "P" "P" "P" ...
```

Note that time now becomes important, so the dateTime is a POSIXct, and the time zone is included. Data is pulled from `http://waterservices.usgs.gov/rest/IV-Test-Tool.html`. There are occasions where NWIS values are not reported as numbers, instead a common example is "Ice". Any value that cannot be converted to a number will be reported as NA in this package.

A simple plotting example is shown in Figure 2:

```
> with(dischargeToday, plot(datetime, X02_00060, xlab = "Date/Time",
     ylab = "Discharge [cfs]"))
```

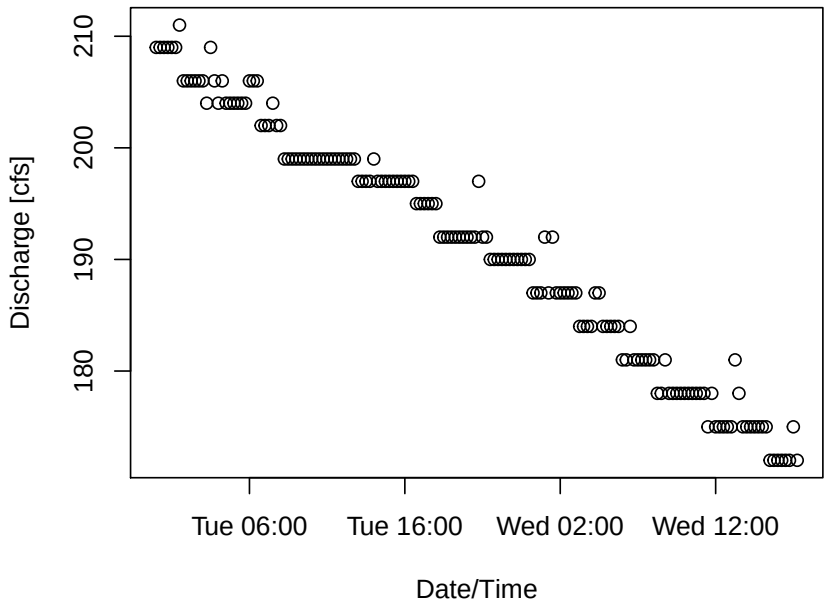

Figure 2: Real-time discharge plot of Choptank River.

3.6 USGS Water Quality Retrievals

Finally, we can use the dataRetrieval package to get water quality data that is available on the water quality data portal: `http://www.waterqualitydata.us/`. The raw data us obtained from the function getRawQWData, with the similar input arguments: siteNumber, parameterCd, startDate, endDate, and interactive. The difference is in parameterCd, in this function multiple parameters can be queried using a ";" separator, and setting parameterCd <- "" will return all of the measured observations. The raw data can be overwelming (as will be demonstrated), a simplified version of the data can be obtained using getQWData.

```
> siteNumber <- "01491000"
> parameterCd <- "00618;71851"
> startDate <- "1964-06-11"
> endDate <- "2012-12-18"
> dissolvedNitrate <- getRawQWData(siteNumber, parameterCd, startDate,
     endDate)
```

Producing a dataframe with the following columns:

```
 [1] "OrganizationIdentifier"
 [2] "OrganizationFormalName"
 [3] "ActivityIdentifier"
```

```
 [4] "ActivityTypeCode"
 [5] "ActivityMediaName"
 [6] "ActivityMediaSubdivisionName"
 [7] "ActivityStartDate"
 [8] "ActivityStartTime.Time"
 [9] "ActivityStartTime.TimeZoneCode"
[10] "ActivityEndDate"
[11] "ActivityEndTime.Time"
[12] "ActivityEndTime.TimeZoneCode"
[13] "ActivityDepthHeightMeasure.MeasureValue"
[14] "ActivityDepthHeightMeasure.MeasureUnitCode"
[15] "ActivityDepthAltitudeReferencePointText"
[16] "ActivityTopDepthHeightMeasure.MeasureValue"
[17] "ActivityTopDepthHeightMeasure.MeasureUnitCode"
[18] "ActivityBottomDepthHeightMeasure.MeasureValue"
[19] "ActivityBottomDepthHeightMeasure.MeasureUnitCode"
[20] "ProjectIdentifier"
[21] "ActivityConductingOrganizationText"
[22] "MonitoringLocationIdentifier"
[23] "ActivityCommentText"
[24] "SampleAquifer"
[25] "HydrologicCondition"
[26] "HydrologicEvent"
[27] "SampleCollectionMethod.MethodIdentifier"
[28] "SampleCollectionMethod.MethodIdentifierContext"
[29] "SampleCollectionMethod.MethodName"
[30] "SampleCollectionEquipmentName"
[31] "ResultDetectionConditionText"
[32] "CharacteristicName"
[33] "ResultSampleFractionText"
[34] "ResultMeasureValue"
[35] "ResultMeasure.MeasureUnitCode"
[36] "MeasureQualifierCode"
[37] "ResultStatusIdentifier"
[38] "StatisticalBaseCode"
[39] "ResultValueTypeName"
[40] "ResultWeightBasisText"
[41] "ResultTimeBasisText"
[42] "ResultTemperatureBasisText"
[43] "ResultParticleSizeBasisText"
[44] "PrecisionValue"
[45] "ResultCommentText"
[46] "USGSPCode"
[47] "ResultDepthHeightMeasure.MeasureValue"
[48] "ResultDepthHeightMeasure.MeasureUnitCode"
```

```
[49] "ResultDepthAltitudeReferencePointText"
[50] "SubjectTaxonomicName"
[51] "SampleTissueAnatomyName"
[52] "ResultAnalyticalMethod.MethodIdentifier"
[53] "ResultAnalyticalMethod.MethodIdentifierContext"
[54] "ResultAnalyticalMethod.MethodName"
[55] "MethodDescriptionText"
[56] "LaboratoryName"
[57] "AnalysisStartDate"
[58] "ResultLaboratoryCommentText"
[59] "DetectionQuantitationLimitTypeName"
[60] "DetectionQuantitationLimitMeasure.MeasureValue"
[61] "DetectionQuantitationLimitMeasure.MeasureUnitCode"
[62] "PreparationStartDate"
```

To get a simplified dataframe that contains only datetime, value, and qualifier, use the function getQWData:

```
> dissolvedNitrateSimple <- getQWData(siteNumber, parameterCd,
     startDate, endDate)
> head(dissolvedNitrateSimple)
```

```
     dateTime qualifier.71851 value.71851 qualifier.00618 value.00618
1  1964-06-11                         3.3                       0.745
3  1964-09-10                         5.3                       1.200
5  1965-02-01                         2.9                       0.655
7  1965-02-25                         2.4                       0.542
9  1965-03-25                         1.5                       0.339
11 1965-04-20                         2.2                       0.497
```

Note that in this dataframe, datatime is only imported as Dates (no times are included), and the qualifier is either blank or "<" signifying a censored value.

An example of plotting the above data (Figure 3):

```
> with(dissolvedNitrateSimple, plot(dateTime, value.00618, xlab = "Date",
     ylab = paste(parameterINFO$srsname, "[", parameterINFO$parameter_units,
         "]")))
```

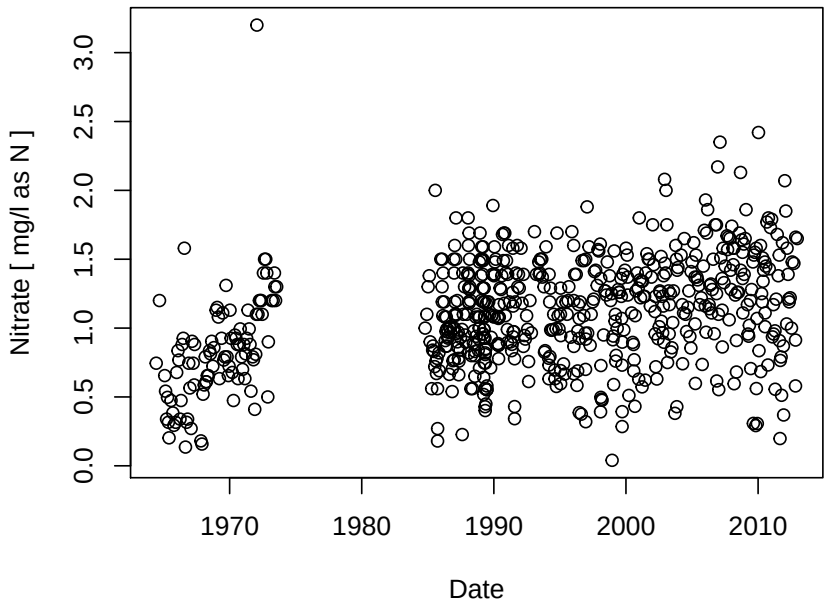

Figure 3: Nitrate plot of Choptank River.

4 Polished Data: USGS Web Retrieval Examples

Rather than using raw data as retrieved by the web, the dataRetrieval package also includes functions that return the data in a structure that has been designed to work with the EGRET R package. In general, these dataframes may be much more 'R-friendly' than the raw data, and will contain additional information that allows for efficient data analysis.

In this section, we use 3 dataRetrieval functions to get sufficient data to perform an EGRET analysis. We will continue analyzing the Choptank River. We will need essentially the same data that was retrieved in the previous section, but we will get the daily discharge values in a dataframe called Daily, the nitrate sample data in a dataframe called Sample, and the data about the station and parameters in a dataframe called INFO. These are the dataframes that were exclusively designed to work with the EGRET R package, however can be very useful for all hydrologic studies.

The funtion to obtain the daily values (discharge in this case) is getDVData. It requires the inputs siteNumber, ParameterCd, StartDate, EndDate, interactive, and convert. Most of these arguments are described in the previous section, however 'convert' is a new argument, it's default is TRUE, and it tells the program to convert the values from cfs to cms. If you don't want this conversion, set convert=FALSE in the function call.

The function to obtain sample data from the water quality portal is getSampleData. The arguments for this function are also siteNumber, ParameterCd, StartDate, EndDate, interactive.

```
> siteNumber <- "01491000"
> parameterCd <- "00631"
> startDate <- "1964-01-01"
> endDate <- "2013-01-01"
> Daily <- getDVData(siteNumber, "00060", startDate, endDate)

There are  17899 data points, and  17899 days.
There are  0 zero flow days
If there are any zero discharge days, all days had 0 cubic meters per second added to the c

> Sample <- getSampleData(siteNumber, parameterCd, startDate, endDate)
> INFO <- getMetaData(siteNumber, parameterCd, interactive = FALSE)
> Sample <- mergeReport()

 Discharge Record is 17899 days long, which is 49 years
 First day of the discharge record is 1964-01-01 and last day is 2013-01-01
 The water quality record has 627 samples
 The first sample is from 1973-06-04 and the last sample is from 2012-12-18
 Discharge: Minimum, mean and maximum 0.00991 4.02 246
 Concentration: Minimum, mean and maximum 0.05 1.1 2.4
 Percentage of the sample values that are censored is 0.16 %

> head(Sample)
